atomic-potential fields for the zincblende structure

$$V_j(\mathbf{r}) = V_{0j} + \frac{1}{2}\alpha_j(u_1^2 + u_2^2 + u_3^2) + \beta_j u_1 u_2 u_3 + \dots$$

were obtained as $\alpha_{\text{Cu}} = 0.74 \pm 0.01$, $\alpha_{\text{Cl}} = 1.35 \pm 0.02 \times 10^{-12} \text{erg } \text{\AA}^{-2}$, and $\beta_{\text{Cu}} = 1.15 \pm 0.66$, $\beta_{\text{Cl}} = 0.0 \pm 1.6 \times 10^{-12} \text{erg } \text{\AA}^{-3}$. It is also shown that the temperature dependence of the Bragg reflexion observed from room temperature to 523 °K can be explained very well with the use of the above parameters.

An Analysis of the Rietveld Profile Refinement Method

BY M. SAKATA* AND M. J. COOPER

Materials Physics Division, AERE, Harwell, Oxfordshire, OX11 0RA, England

(Received 24 August 1978; accepted 25 June 1979)

Abstract

An analysis of the Rietveld profile refinement method used in the interpretation of neutron or X-ray powder diffraction patterns has been carried out. It is shown that the values obtained for the structural parameters are not exactly the same as those obtained from an integrated intensity refinement of the same data and that the standard deviations of the parameters are determined incorrectly. Whilst the differences in the values of the parameters may not be statistically significant, the fact that their standard deviations are estimated incorrectly severely limits their usefulness. These conclusions are confirmed by refinement of a number of data sets using both methods and in most of these cases the standard deviations are found to be underestimated by the profile refinement method by a factor of at least two. Discussions based on the results of profile refinement must therefore be reconsidered and the relative value of powder diffraction techniques must be reviewed.

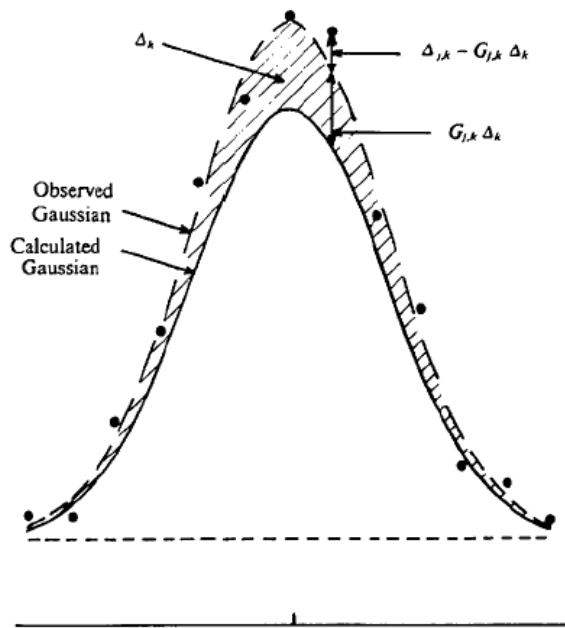

Fig. 1. Illustration of the correlation between $\Delta_{j,k}$ values for the same Bragg peak. The observed points are distributed randomly about the observed peak rather than the calculated peak, so that the differences which must be considered statistically are Δ_k and $\Delta_{j,k} - G_{j,k} \Delta_k$ rather than $\Delta_{j,k}$.

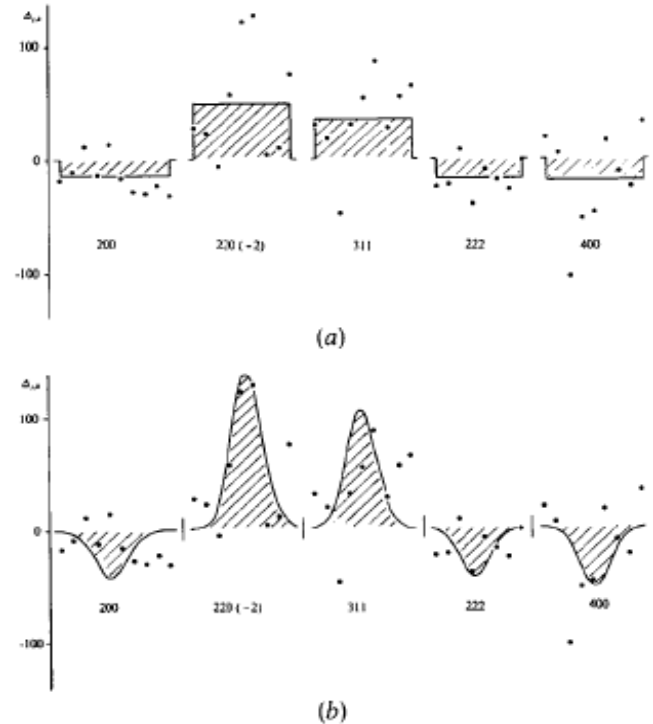

Fig. 2. Values of $\Delta_{j,k}$ for five peaks in the profile for UO_2 , showing their correlation for the same Bragg peak. The shaded areas correspond to the values of Δ_k . (a) The solid lines give the average values of $\Delta_{j,k}$ for each peak. (b) The solid lines correspond to the values of $G_{j,k} \Delta_k$.

Short Communication

The Neutron scattering amplitude of Uranium

M. J. Cooper and M. Sakata*

Materials Physics Division, AERE Harwell, Oxon., OX11 0RA, England

Received: November 28, 1978

Abstract. Reanalysis of six different sets of neutron diffraction data for UO_2 leads to a value of the neutron scattering amplitude ratio of $b_u/b_o = 1.451(2)$ and hence a value for the neutron scattering amplitude of uranium of b_u between $0.842(2)$ and $0.846(2) \times 10^{-12}$ cm.

J. Phys. F: Metal Phys., 11(1981)L157-62. Printed in Great Britain

LETTER TO THE EDITOR

Chemical short-range order in liquid and amorphous $\text{Cu}_{66}\text{Ti}_{34}$ alloys

M Sakata^{†§}, N Cowlam[†] and H A Davies[‡]

[†] Department of Physics, University of Sheffield, Sheffield, S3 7RH, England, UK

[‡] Department of Metallurgy, University of Sheffield, Sheffield, S1 3JD, England, UK

Received 6 March 1981, in final form 26 March 1981

Figure 1. The structure factor $S(Q)$ for liquid $\text{Cu}_{66}\text{Ti}_{34}$ is shown together with $S(Q)$ for $\text{Cu}_{66}\text{Ti}_{34}$ glass, both curves being obtained from neutron diffraction. The inset shows a comparison of the structure factors of $\text{Cu}_{66}\text{Ti}_{34}$ glass obtained by neutron and x-ray diffraction.

Figure 2. The structure factor $S(Q)$ for $\text{Fe}_{83}\text{B}_{17}$ metallic glass with $Q_{\text{max}} = 9.78 \text{ \AA}^{-1}$, derived from a neutron diffraction measurement.

$$\langle f^2 \rangle S(Q) = \langle f^2 \rangle S_{NN}(Q) + 2 \Delta f \langle f \rangle S_{NC}(Q) + \Delta f^2 S_{CC}(Q). \quad (2)$$

For a binary alloy $A_{C_A}B_{C_B}$, the atomic scattering factors have the following values

$$\langle f \rangle = C_A f_A + C_B f_B,$$

$$\langle f^2 \rangle = C_A f_A^2 + C_B f_B^2,$$

$$\Delta f = f_A - f_B.$$

MEM for Charge density study.

Collins's formalism is based on the entropy expression, S , obtained by Jaynes(1968):

Information Entropy
$$S = -\sum_{\mathbf{r}} \rho'(\mathbf{r}) \ln \frac{\rho'(\mathbf{r})}{\tau'(\mathbf{r})}$$

The probability of $r(\mathbf{r})$ and prior probability $t(\mathbf{r})$ are connected with the actual density by

$$\rho'(\mathbf{r}) = \rho(\mathbf{r}) / \sum_{\mathbf{r}} \rho(\mathbf{r}), \quad \tau'(\mathbf{r}) = \tau(\mathbf{r}) / \sum_{\mathbf{r}} \tau(\mathbf{r})$$

We introduce a constrain as given information.
$$C = \frac{1}{N} \sum_{\mathbf{k}} \frac{|F_{cal}(\mathbf{k}) - F_{obs}(\mathbf{k})|^2}{\sigma^2(\mathbf{k})}$$

Where,
$$F_{cal}(\mathbf{k}) = V \sum_{\mathbf{r}} \rho(\mathbf{r}) \exp[-2\pi i \mathbf{k} \cdot \mathbf{r}]$$

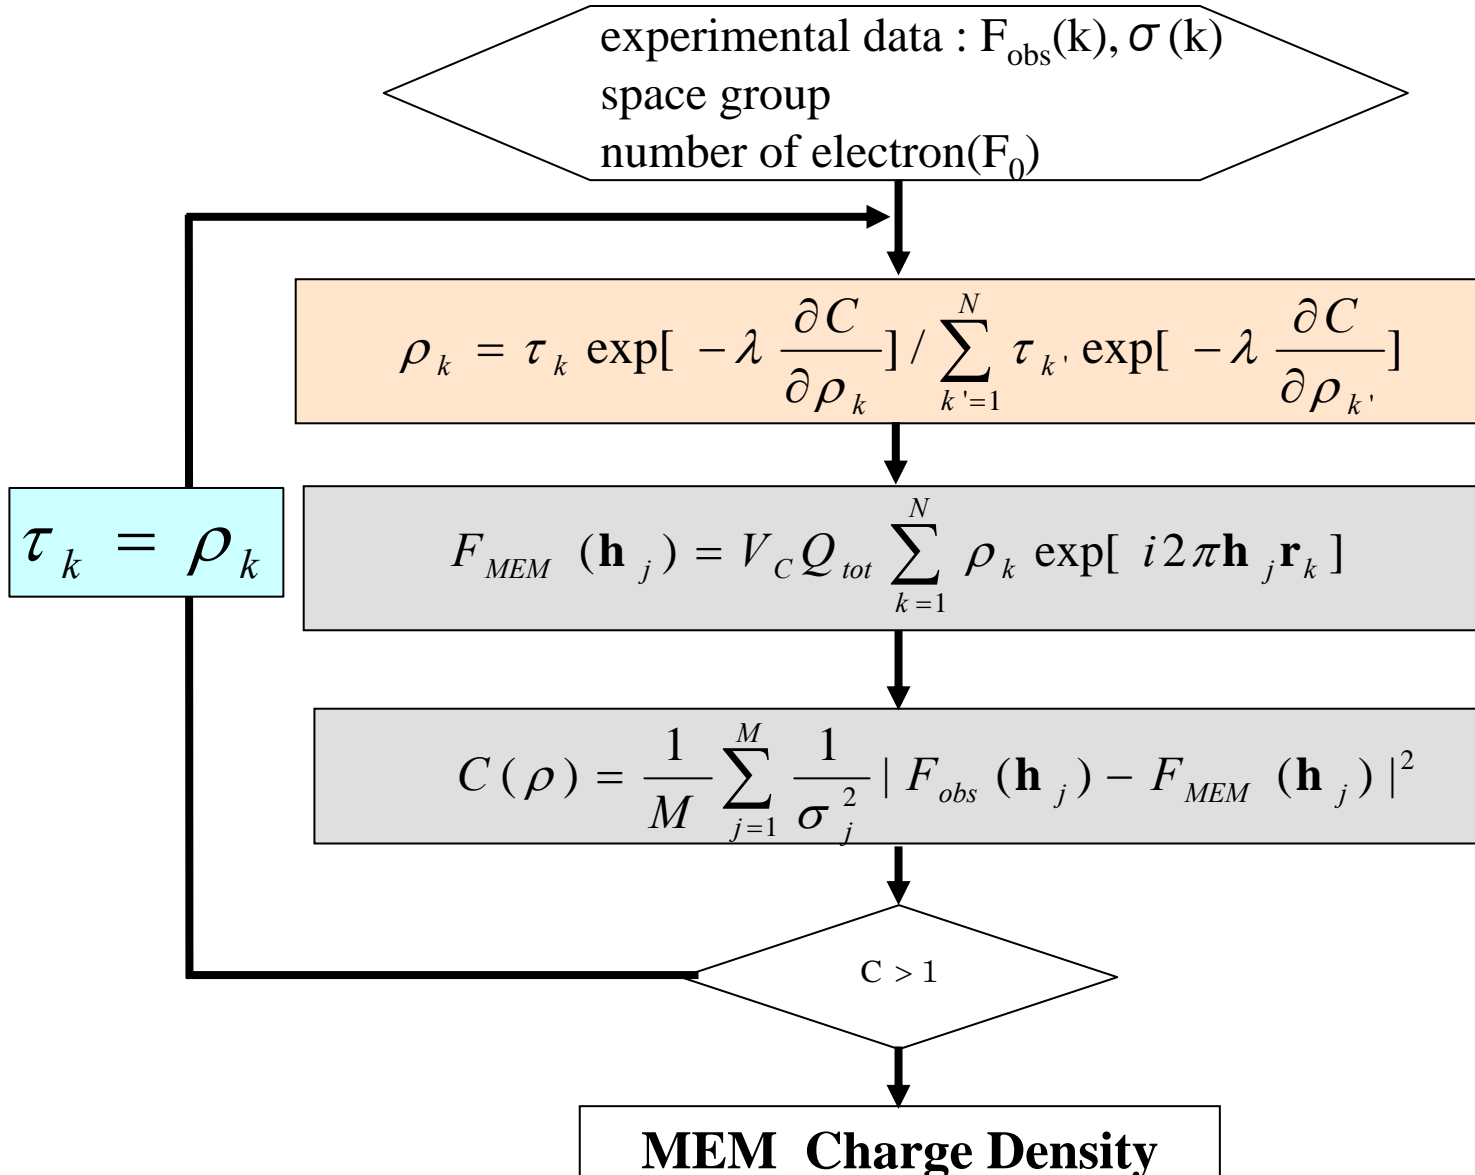

We use Lagrange's method of undetermined multipliers to constrain C to be unity while we maximize the entropy.

$$Q(\lambda) = -\sum_{\mathbf{r}} \rho'(\mathbf{r}) \ln \frac{\rho'(\mathbf{r})}{\tau'(\mathbf{r})} - \frac{\lambda}{2} (C - 1)$$

By setting $\frac{\partial Q(\lambda)}{\partial \rho'(\mathbf{r})} = 0$, we have
$$\rho(\mathbf{r}) = \tau(\mathbf{r}) \cdot \exp \left[\frac{\lambda F_0}{N} \sum_{\mathbf{k}} \frac{\{F_{obs}(\mathbf{k}) - F_{cal}(\mathbf{k})\}}{\sigma^2(\mathbf{k})} \exp(-2\pi i \cdot \mathbf{k} \cdot \mathbf{r}) \right]$$

$$F_{cal}(\mathbf{k}) = V \sum_{\mathbf{r}} \tau(\mathbf{r}) \exp[-2\pi i \mathbf{k} \cdot \mathbf{r}]$$

(b)

Fig. 4. The MEM maps of the nuclear-density distribution of rutile obtained by the third approach; (a) and (b) show maps on the (002) and (110) planes, respectively. The contour range is from 0 to 10 with intervals of 1.0 (neutrons \AA^{-3}). These figures are judged to provide realistic representations of the nuclear density in rutile and it has been concluded that the third approach to dealing with negative scattering lengths is very satisfactory.

Fig. 1. Third approach: schematic illustration of the iterative procedure used to solve the two MEM equations.

Essential Science Indicators

Dear M Sakata,

It's time to celebrate!

Since 2000, you have had 47 citations to your article,
THE LARGE DEBYE-SCHERRER CAMERA INSTALLED AT
SPRING-8 BL02B2 FOR CHARGE DENSITY STUDIES

This means that the number of citations your article received places it in the top 1% within its field according to *Essential Science Indicators*SM. Your work is highly influential, and is making a significant impact among your colleagues in your field of study.

Keep track of your article's influence:
set up a citation alert in *Web of Science*[®].

If your institution subscribes, simply go to
<http://isiknowledge.com>, and click
"Create Citation Alert" on your article's full record.

If you do not have access to *Web of Science*, the most
in-depth and respected source of citation information and
searching available, ask your librarian to set up a free trial.

**Congratulations on your extraordinary
career accomplishment!**

MEM/Rietveld for Endohedral metallofullerene

Confirmation by X-ray diffraction of the endohedral nature of the metallofullerene $Y@C_{82}$

Masaki Takata*, Buntaro Umeda*, Eiji Nishibori*, Makoto Sakata*, Yahachi Saito†, Makoto Ohno‡ & Hisanori Shinohara‡

* Department of Applied Physics, Nagoya University, Nagoya 464-01, Japan

† Department of Electrical and Electronic Engineering, Mie University, Tsu 514, Japan

‡ Department of Chemistry, Nagoya University, Nagoya 464-01, Japan

THE synthesis of fullerenes encapsulating various metal atoms within the carbon cage (endohedral metallofullerenes) has stimulated wide interest^{1,2} because of their unusual structural and electronic properties. Most of the metallofullerenes prepared so far have been based on C_{82} , and have incorporated lanthanum^{1,3,5}, yttrium^{6,7}, scandium^{8,10} and most of the lanthanide elements^{11,12}. Although there has been some debate about the endohedral nature of these compounds^{2,13,14}, observations using scanning tunnelling microscopy^{15,16}, extended X-ray absorption fine structure^{17,18}, transmission electron microscopy¹⁹ and electron spin resonance^{3,6,8,10} have strongly suggested that the metal atoms are indeed inside the fullerene cages; theoretical calculations^{20,21} also indicate that this is the case. But until now, no structural model

has been derived experimentally to confirm the endohedral nature of the metallofullerenes. Here we report the results of a synchrotron X-ray powder diffraction study of $Y@C_{82}$ that confirms that the yttrium atom is located within the carbon cage. The yttrium atom is displaced from the centre of the C_{82} molecule and is strongly bound to the carbon cage.

Soot containing $Y@C_{82}$ was produced in direct-current (500 A) spark mode under He flow at 50 Torr and collected under totally anaerobic conditions to avoid degradation of the metallofullerene during collection and handling^{15,16,22}. The $Y@C_{82}$ fullerene was separated and isolated from various hollow fullerenes (C_{60} – C_{110}) by two-stage high-performance liquid chromatography (HPLC)²². The isolation of $Y@C_{82}$ was confirmed by mass spectrometry for the corresponding HPLC fraction. The purity of the fullerene was >99.9%. $Y@C_{82}$ powder samples grown from toluene solvent²² were sealed in 0.3 mm int. diam. silica glass capillary. To obtain an X-ray powder pattern with good counting statistics, the Synchrotron Radiation X-ray powder experiment with Imaging Plates as detectors²³ was carried

out at Photon Factory. The wavelength of the incident X-rays was 0.10417 nm. The data for the hollc ence under the sa pattern of $Y@C$ sponds to 2.9 Å whether the Y at ous X-ray single-space group of t preliminary struc model. The prese good agreement) of $Y@C_{82}$ is also

M. Takata *et al.*,
Nature (1995)

Atom in a cage

Not abstract art, but concrete evidence of something that fullerene specialists had hoped and suspected to be the case, the figure shown here demonstrates that a metal atom can indeed be trapped within a cage of carbon. The contours map the electron density across a section through the metallofullerene $Y@C_{82}$, the shorthand notation for yttrium in an 82-carbon cage. The pink and swollen bulge inside the circle's lower rim shows the high electron density expected to be associated with the yttrium atom — here clearly ensconced within the blue carbon framework. Theory and experiment had both suggested that this was so; but the new

structure, derived from X-ray powder diffraction experiments, may finally allay any doubts. Details of the experiment, carried out by Japanese researchers M. Takata *et al.* at Mie and Nagoya Universities, can be found on page 46 of this issue.

溶媒領域

Disorder

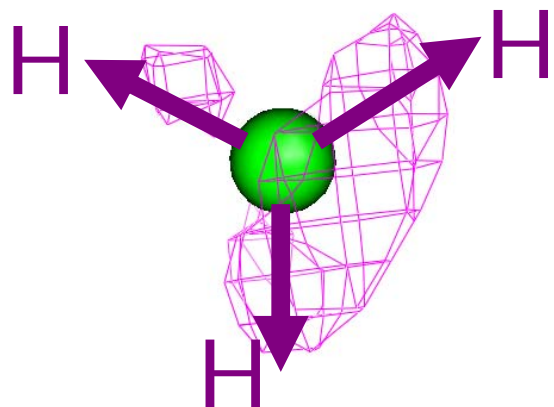

水素原子

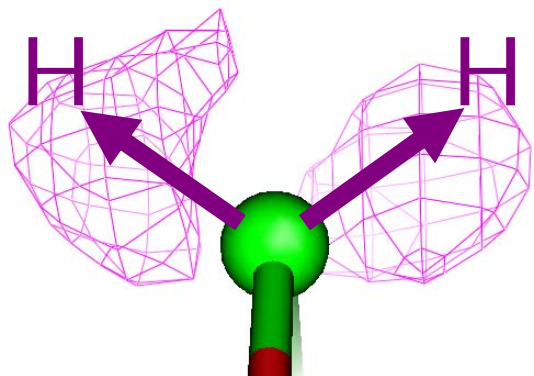

原子の異方性熱振動

水素原子

メチル基

炭素鎖

— : 差MEM Density $0.4[e/\text{\AA}^3]$

R1 = 14.73%

メチル基

炭素鎖

— : 差MEM Density $0.4[e/\text{\AA}^3]$

R1 = 13.92%

本研究で検討した項目

溶媒領域

Disorder

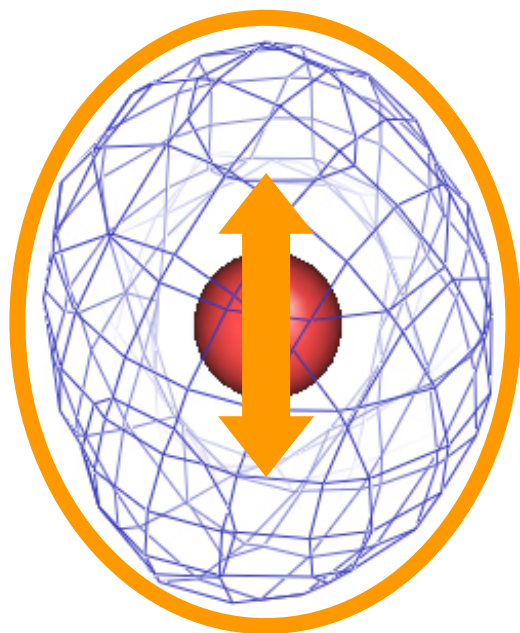

水素原子

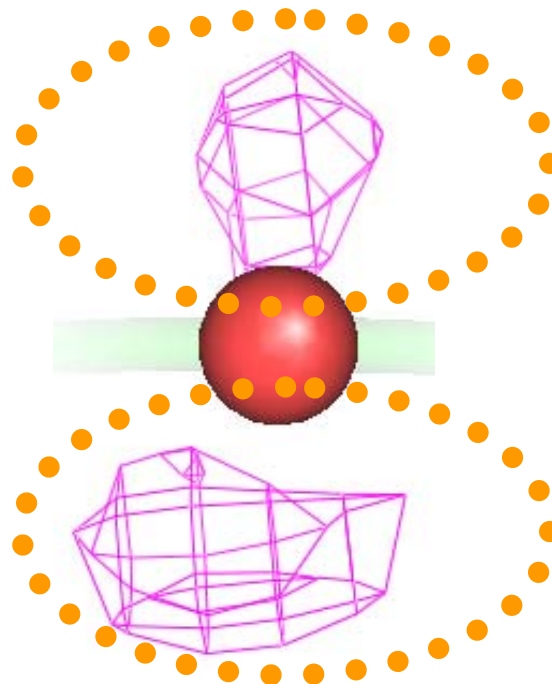

原子の異方性熱振動

原子の異方性

原子の異方性の確認

— : MEM Density $2.0[e/\text{\AA}^3]$

— : 差MEM Density $0.4[e/\text{\AA}^3]$

楕円体状のMEM電子密度

- XFEL(X-ray Free Electron Laser)

X線自由電子レーザー

2010年度の完成を目指し、2006年から施設の建設が始まりました。

- J-PARC(Japan Proton Accelerator Research Complex) MLF

大強度陽子加速器施設

2001年度に建設に着手, 2008年度中には、ビームを供給の予定です。

- ERL(Energy Recovery Linac)

エネルギー回収型ライナック
