

# Course II : Calculus

# What is Calculus ?

**Calculus** is a branch of mathematics.

- functions, • limits, • derivatives, • integrals, • power series

**Calculus** is the study of change.

- cf. • **Geometry** is the study of shape.  
• **Algebra** is the study of operation.

**Calculus** is a gateway to advanced mathematics.

- We must study and understand completely.

**Calculus** has wide applications in

- science, • engineering, • economics, • biology

**Calculus** has two branches

- differential calculus, • integral calculus,

# Contents

- Lesson 01** Limit of Functions and Derivatives
- Lesson 02** Derivative and Graphs
- Lesson 03** Differentiation Formulas
- Lesson 04** Derivatives of Trigonometric Functions
- Lesson 05** Derivatives of Logarithmic Functions and Exponential Functions
- Lesson 06** Applications of Derivatives to Equations and Inequality
- Lesson 07** Application to Physics
- Lesson 08** Approximation of a Function
- Lesson 09** Antiderivatives
- Lesson 10** Definite Integrals
- Lesson 11** Estimating Area by Rectangles
- Lesson 12** Application of Integrals (1)
- Lesson 13.** Application of Integrals (2)
- Lesson 14.** Differential Equations (1)
- Lesson 15.** Differential Equations (2)

## Lesson 1

# Limit of Functions and Derivatives

### 1A

- Limit of a function

# Definition of a Limit

## Definition of a Limit

If a function  $f(x)$  can be made to be as close to  $L$  as desired by making  $x$  sufficiently close to  $a$ , we say that

“the limit of  $f(x)$ , as  $x$  approaches  $a$ , is  $L$ ”  
and we write as follows

$$\lim_{x \rightarrow a} f(x) = L$$

We can also write  $f(x) \rightarrow L$  as  $x \rightarrow a$

and read “ $f(x)$  approaches  $L$  as  $x$  approaches  $a$ .”

# Limit of a Function

[Example]  $f(x) = x^2$

$x$	$f(x)$	$x$	$f(x)$
1.0	1.000000	3.0	9.000000
1.5	2.250000	2.5	6.250000
1.8	3.240000	2.2	4.840000
1.9	3.610000	2.1	4.410000
1.99	3.960100	2.01	4.040100
1.999	3.996001	2.001	4.004001

The limit of  $f(x) = x^2$  as  $x$  approaches 2 is 4

# Several Comments about the Limit

- For the limit of a function to exist, the **left-hand** and **right-hand** limits must be equal, that is

$$\lim_{x \rightarrow a^-} f(x) = L \quad \text{and} \quad \lim_{x \rightarrow a^+} f(x) = L$$

Limit does not exist  
at  $x = 2$

- $\lim_{x \rightarrow a} f(x) = L$  is not always equal to  $f(a)$

# Example

**Example 1.1** Find the limit value of the following function.

$$\lim_{x \rightarrow 1} \frac{x^2 - x}{x - 1}$$

**Ans.**

$$\lim_{x \rightarrow 1} \frac{x^2 - x}{x - 1} = \lim_{x \rightarrow 1} \frac{x(x - 1)}{x - 1} = \lim_{x \rightarrow 1} x = 1$$

- Even if the function has not a value at  $x = a$ , the limit may exist.

## Indeterminate Form

The forms  $0^0$ ,  $\frac{0}{0}$ ,  $1^\infty$ ,  $\infty - \infty$ ,  $\frac{\infty}{\infty}$ ,  $0 \times \infty$ ,  $\infty^0$ , etc. are called **indeterminate**

**forms** because they do not give enough information to determine values. 8

# Example

**Example 1.2** Find the limit value of the following function.

$$\lim_{x \rightarrow 1} \frac{\sqrt{x+1} - 1}{x}$$

**Ans.**

$$\begin{aligned} \lim_{x \rightarrow 1} \frac{\sqrt{x+1} - 1}{x} &= \lim_{x \rightarrow 1} \frac{(\sqrt{x+1} - 1)(\sqrt{x+1} + 1)}{x(\sqrt{x+1} + 1)} = \lim_{x \rightarrow 1} \frac{(x+1) - 1}{x(\sqrt{x+1} + 1)} \\ &= \lim_{x \rightarrow 1} \frac{1}{(\sqrt{x+1} + 1)} = \frac{1}{2} \end{aligned}$$

**Means to find a limit of an Indeterminate Form 0/0**

- (1) Case of Polynomial → **Factor them**
- (2) Case of Irrational Function → **Multiply the conjugate**

## Example

**Example 1.3** Determine the values of  $a$  and  $b$  so that the following expression holds.

$$\lim_{x \rightarrow 1} \frac{x^2 + x - 2}{x^2 + ax + b} = 1$$

**Ans.**

When  $x \rightarrow 1$ , then  $x^2 + x - 2 \rightarrow 0$  and  $x^2 + ax + b \rightarrow 1 + a + b$

In order for limit to exist,  $1 + a + b$  must be zero.  $\therefore b = -a - 1$

Substituting this, we have

$$\lim_{x \rightarrow 1} \frac{x^2 + x - 2}{x^2 + ax + b} = \lim_{x \rightarrow 1} \frac{(x-1)(x+2)}{(x-1)(x+a+1)} = \lim_{x \rightarrow 1} \frac{(x+2)}{(x+a+1)} = \frac{3}{a+2}$$

Therefore,

$$\frac{3}{a+2} = 1 \quad \therefore a = 1 \text{ and } b = -2$$

# Exercise

**[ Exercise 1.1 ]** Determine the values of  $a$  and  $b$  so that the following relationship holds.

$$\lim_{x \rightarrow 1} \frac{ax^2 + bx + 1}{x - 1} = 3$$

**Ans.**

Pause the video and try to solve by yourself

# Answer to the Exercise

**[ Exercise 1.1 ]** Determine the values of  $a$  and  $b$  so that the following relationship holds.

$$\lim_{x \rightarrow 1} \frac{ax^2 + bx + 1}{x - 1} = 3$$

**Ans.**

When  $x \rightarrow 1$ , then  $x - 1 \rightarrow 0$  and  $ax^2 + bx + 1 \rightarrow a + b + 1$

In order to exist a limit value 1,  $a + b + 1 = 0 \quad \therefore b = -a - 1$

Substituting this, we have

$$\lim_{x \rightarrow 1} \frac{ax^2 + bx + 1}{x - 1} = \lim_{x \rightarrow 1} \frac{(x - 1)(ax - 1)}{x - 1} = \lim_{x \rightarrow 1} (ax - 1) = a - 1$$

Therefore,

$$a - 1 = 3 \quad . \text{ Namely, } a = 4 \quad \text{and} \quad b = -5$$

# Lesson 1

## Limit of Functions and Derivatives

### **1B**

- Derivatives of Functions

# Average Rate of Change

Increments

$$\Delta x = x_2 - x_1$$

$$\Delta y = y_2 - y_1$$

The **slope**  $\frac{\Delta y}{\Delta x}$

## Average Rate of Change

$$\frac{\Delta y}{\Delta x} \quad \text{or} \quad \frac{f(b) - f(a)}{b - a}$$

# Definition of a Derivative

## Derivative

The slope at point A (the **tangent line T**) can be obtained by making point B approach point A.

$$\lim_{b \rightarrow a} \frac{f(b) - f(a)}{b - a} = f'(a)$$

This is called **the derivative** of  $f(x)$  at  $a$

Putting  $b = a + h$ , we also have

$$\lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h} = f'(a)$$

That makes sense!

# How to Find the Derivative

**[Example 1-4]** About the function  $f(x) = x^2$

- (1) Find the average rate of change between  $x = 1$  and  $x = 2$ .
- (2) Find the instantaneous rate of change at  $x = a$ .
- (3) Find the point where the instantaneous rate of change is equal to the average rate of change between  $x = 1$  and  $x = 2$ .

**Ans.** (1) 
$$\frac{f(2) - f(1)}{2 - 1} = 4 - 1 = 3$$

(2) 
$$f'(a) = \lim_{h \rightarrow 0} \frac{(a + h)^2 - a^2}{h} = \lim_{h \rightarrow 0} (2a + h) \\ = 2a$$

(3) Using the results of (1) and (2), we put  $2a = 3$

$$\therefore a = \frac{3}{2}$$

# Derivative as a Function

Let the number  $a$  varies and replace it by  $x$ .

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$f'(x)$  is called **the derivative** of  $f(x)$   
 or **the derivative function** of  $f(x)$   
 ( because it has been “**derived**” from  $f(x)$  . )

## Alternative notation

$$f'(x) = y' = \frac{dy}{dx} = \frac{df}{dx} = \frac{d}{dx} f(x) = Df(x) = D_x f(x)$$

[note]

The definition  $\frac{dy}{dx}$  is read as : “*the derivative with respect to  $x$* ”, “*by  $y$* ”, “*over  $dx$* ” or simply “ *$dy$  over  $dx$* ”

# How to Find a Derivative Function

**[Example 1-4]** Find the derivative function of

$$(1) \quad f(x) = x \quad (2) \quad f(x) = x^2 \quad (3) \quad f(x) = x^3$$

**Ans.** Definition  $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$(1) \quad f'(x) = \lim_{h \rightarrow 0} \frac{(x+h) - x}{h} = \lim_{h \rightarrow 0} (1) = 1$$

$$(2) \quad f'(x) = \lim_{h \rightarrow 0} \frac{(x+h)^2 - x^2}{h} = \lim_{h \rightarrow 0} (2x + h) = 2x$$

$$(3) \quad f'(x) = \lim_{h \rightarrow 0} \frac{(x+h)^3 - x^3}{h} = \lim_{h \rightarrow 0} (3x^2 + 3xh + h^2) = 3x^2$$

## Formula

$$\frac{d}{dx} (x^n) = nx^{n-1}$$

# Higher Derivatives

Since  $f'(x)$  is a function, it also has its own derivative which is denoted by

$$\frac{d^2 y}{dx^2} = f''(x) = f^{(2)}(x) \quad : \text{The second derivative function}$$

We can continue

$$\frac{d^3 y}{dx^3} = f'''(x) = f^{(3)}(x) \quad : \text{The third derivative function}$$

The process of finding a derivative function is called **differentiation**.

# Example

**[Example 1-5]** If  $f(x) = x^3 - x$ , find and interpret  $f''(x)$

Using the formula  $\frac{d}{dx}(x^n) = nx^{n-1}$ , we get

$$f'(x) = 3x^2 - 1$$

$$f''(x) = 6x$$

These derivatives are illustrated in the Right-hand side.

- $f''(x)$  is the slope of the curve  $y = f'(x)$
- $f''(x)$  is the rate of change of  $y = f'(x)$

# Exercise

**[ Exercise 1.2 ]** Function  $f(x) = x^3 + ax^2 + bx + c$   
Satisfy the conditions  $f(1) = 3$  ,  $f(0) = 1$  and  
 $f'(-1) = 16$  . Find the constants  $a$ ,  $b$  and  $c$  .

**Ans.**

Pause the video and try to solve by yourself

# Answer to the Exercise

**[ Exercise 1.2 ]** Function  $f(x) = x^3 + ax^2 + bx + c$   
Satisfy the conditions  $f(1) = 3$  ,  $f(0) = 1$  and  
 $f'(-1) = 16$  . Find the constants  $a$ ,  $b$  and  $c$  .

**Ans.**

The derivative function is

$$f'(x) = 3x^2 + 2ax + b$$

Given condition

$$f(1) = 1 + a + b + c = 3$$

$$f(0) = c = 1$$

$$f'(-1) = 3 - 2a + b = 16$$

From these equations

$$a = -4, b = 5, c = 1$$
